About Guanyu

Company Introduction

Guanyu ceramics is holding stock of shijiazhuang guanyu industrial and trading import and export co.,ltd. which is a multi-corporation combined of industry, trading and researching. " Quality first, best credit " is our tenet.

Guanyu ceramics, specializing in making mosaics, polished tiles, rustic tiles and glazed internal wall tiles, makes our brand "guanyu ceramics" popular around the world and established worldwide distribution channels in many countries and areas under the support of many clients.

Making first quality products, respecting science, protecting environment, treasuring employee and stringent in management, we got ISO9001:2000 certificate, ISO14001:2004, GB/T28001-2001 and compulsory 3C certificate and strictly carries out their standard systems. our products feature low water absorption rate, good smoothness, tight size tolerance, bright luster as well as stable physical and chemical properties, leading the new porcelain and ceramics consuming trend with elegant design styles and fashion patterns.

We will keep on working for a promising future.

INK JET SERIES

INSTRUCTIONS OF TILING

TILING STEPS

>1.Unpack to check the size and color number of products so as to use products of the same color number at the same place and avoid confusing products of different color numbers (unless to obtain a special decorative effect intentionally);

>2.Before formal tiling,do some trial work on the ground first. Only after the products of the same color number and size be used.Tiles of different color number and size should be separated and numbered on the bottom for easy identification.If there are designs or directional patterns on tile surface,the tiles should be laid according to the direction of the designs to achieve the best decorative effect.

>3.Currently,wet laying and dry laying are the two commonly used methods for laying ground tiles.

A.Wet laying method:Clean the site and spray some water to facilitate working.Mix 325# cement and sand into mortar at the ratio of 1:3. Use a board about 1m long to fully level out the layer of mortar 25mm~35mm in thickness. Peg out for the laying. Spread cement powder on the ground and even it out before spreading some more cement powder. Lay the tiles according to the pegging to increase the adhesiveness between the times and the cement mortar.

B.Dry laying method: Clean the ground and wet it with water first. Spread a layer of cement mortar mixed at the ratio of 1:0.4~0.5 and then a binding course of dry cement mortar about 50mm thick mixed at the ratio of 1:3. Tamp the layer and fully level it out. Peg out. Spread a layer of cement paste about 7mm thick on the back of tiles and lay them on the binding course according to the pegging. Measure the levelness with a level bar to ensure the flatness of the tiles laid. If adhesive (ceramic tile glue) is used, please follow the directions closely.

>4.During ground tiling, the binding course of cement mortar should preferably be limited in size to prevent the solidification of the binding course from exceeding the pre-hardening time (about 45 minutes), causing an unnecessarily tight adhesion between tiles and the base layer, which is easy to cause quality problems, e.g. bubble;

>5.During joint-leaving laying, the space between polished tiles should be 2mm~5mm, plus a joint of 1mm~3mm that should be left at the edges of staircases, columns, corridors and walls;

>6.The tiling should occur after the base layer has solidified. During the tiling, hold a tile at an angle (about 45 degrees) to the base layer and push it gently horizontally for a full contact between its bottom and the layer surface so squeeze out any bubbles. Then, knock the tile with hammer lightly for further contact to prevent any bubble. Then,use a wooden or rubber hammer to balance the tile bottom on the base layer. Measure with a level bar to ensure the levelness of the tiles so laid;

>7.About 1 hour after the tiling (depending on weather and solidification of cement), use sawdust or sponge to wipe off the cement mortar to prevent the formation of lasting dirt on the surface, which will be hard to clean;

>8.About 12 hours after tiling, use a wooden hammer to knock on the tile surface to check for any bubble. If a hollow sound is heard, it will be evidence of bubble and the tile must be laid again. Before the reworking, use a cutting tool to cut a slot about 5mm~8mm along the edge of the tile. Then use a wooden hammer to hit the tile gently to free its bottom from the binding course before using a thin iron sheet to slowly lift the tile. Only by so doing is it possible to conveniently raise a tile with bubble without damaging the surrounding tiles. For purpose of the rework, the base layer must be cleaned and the binding course must be laid again. All the tiles need to be cleared of any surface dirt in time after laying and should be left for 24 hours before walking on them;

>9.Within 48 hours after the tiles are laid, it is advisable not to use large electric devices, e.g. waxing machine, to prevent the formation of any bubble resulting from the shock on the tiles after they bond with the base layer;

>10.Efforts should be made to prevent vitrified tiles from contact with anything hard during use to avoid any impact on their gloss. Tile surface should be kept clean and free from the soaking of colorful liquid, which must be cleared away as soon as possible if it is dripped on tile surface due to carelessness.

STEPS OF LAYING GLAZED TILES ON INNER WALLS

>1.Leveling: Before tiling, clean the wall surface of any dirt, wet it with water and level it out with cement mortar. The tiling should wait until the leveled surface has dried completely;

>2.During the tiling, reserve a joint of 2mm~3mm between the tiles according to actual needs to prevent any tile from falling off or having bubbles because of the different expansion/contraction coefficient of the wall, tiles and the binding course, which may lead to quality accident;

>3.Line snapping: Decide upon the tile arrangement plan according to design requirements. Mark the position of tiles and joints on the dry leveled-out wall surface;

>4.Laying: Keep the tiles immersed in clean water for about 1 hour until on more bubbles come up. Take out the tiles and wipe off the water stain. Sprinkle sufficient water on the wall surface. Spread a layer of cement mortar evenly on the back of the tiles, which is mixed at the ratio of about 1:2 and about 5mm~6mm in thickness (or thicker for tiles of large size). After the mixing, the grade should be below 200#. Put the tiles on, knock with a wooden or rubber hammer for flatness to avoid any bubble. Always use a ruler or level bar to ensure levelness;

>5.Trimming: After a certain area of tiling, use cement mortar (plaster or gesso slurry) to fill in the joints for leveling. In the end, the tile surface should be cleared of any dirt and receive maintenance;

>6.During the tiling, attention should be paid to the grade, specifications, color number and combination of patterns of tiles. Unless a special decorative effect is sought after, tiles of the same grade, specifications and color number should be used for the same room.
